

Your New Favorite Toy - Onewheel!

You know skateboarding right? Imagine skateboarding without taking your feet off the board. Imagine a self-propelled skateboard - with only one wheel.

It goes forward when you lean forward. It goes backward when you lean backward. It turns left or right when you - yep, you got it - when you lean to the left or right.

That's what Onewheel offers. And it's for everyone, even non-skateboarders.

Onewheel is driven by an electric motor. It's located in the hub of the wheel. Onewheel isn't weak. It has about the same power as most electric bicycles. And all that power is in just one wheel. We're sure Batman would love to ride the Onewheel.

The makers of Onewheel say it is very easy to ride. They say anyone can learn to ride it right away. Even non-skateboarders can ride it after a few practices.

Onewheel is for sale right now. It costs around \$1,000. It's definitely not cheap, but it's unbelievably fun to ride!

Do you skateboard?
